

Scanco License Plate Tracking

Reduce multiple barcode scans to one with license plating.

License plating is a method for grouping and managing inventory by container. You decide what constitutes a container—a pallet, product carton, truck, or ocean freight box can all be a container. Each container is assigned a unique License Plate Number (LPN) and given a barcode label. With RFgen License Plating, you can manage logistics and track key information for a group of items with a single scan.

Inventory Traceability

- Receiving
- Manufacturing
- Warehouse
- Shipping

Improve Traceability and Increase Customer Satisfaction

From managing materials to tracking products through your supply chain, the Scanco License Plating Solution improves efficiency and traceability. While license plating and pallet labels are often associated with outbound shipments, they also improve operational efficiency in receiving, in the warehouse, and on the shop floor.

License Plate Tracking allows you to take advantage of our Scanco Multi-Bin License Plate Feature to track Pallet IDs and Case Packs using scanning technology. Tracking all your items within a pallet is now an easy, simplified process.

SCANCO LICENSE PLATE TRACKING

Group like materials or mixed products

Create a License Plate Label

A single scan identifies and tracks every item on the pallet

1 Receiving

Receive shipments faster by assigning license plates to incoming parts and materials. If available, upload vendor license plate information into your system ahead of time to support single-scan receiving. Pack, unpack, consolidate, and split shipments in receiving by scanning and updating license plates. Create a license plate at the receiving dock to put away items in kits.

2 Warehouse

Use license plates to kit materials together or bundle finished goods in order to increase picking speed. License plating also supports nontraditional forms of picking, such as directed picking and wave picking.

3 Manufacturing

Create a license plate of raw material (parts list) and then stage materials around your workflow. Workers can scan the license plate, measure how much material is being issued, and then subtract that amount from inventory. View inventory balances by license plate to make sure enough material is always staged.

4 Shipping

Confirm and track containers as they're loaded. Plan and manage routes. Nest multiple license plates into a single overarching load license plate. Create and print labels and shipping documents, including ASNs, for your customers.

Do I Need License Plating?

- License plating speeds up warehouse operations by reducing manual data entry and scanning for receiving, putaway, and picking.
- License plating can improve your ability to track items in your warehouse and through your supply chain.
- License plating can make it easier to capture critical information for faster response to audits and recalls.
- A license plating solution with load management capabilities can help you plan your shipments.
- License plating enables you to comply with many EDI labeling requirements.
- Barcode scanning coupled with license plating minimizes errors caused by accidentally skipping steps, missing items, or entering data incorrectly.
